Image Translation Service

2022 March

Application Description

A short description of the application.
We named our App as the <Image Translation Service>, which is an App that allows you to upload images and get translation for the text content in the menu, in both text and audio style.

There are three core features in this App.
1. Recognizing the text content from the image.
2. Providing instant online translation over the recognized content in multi-language.
3. Providing a service that turns the text content into lifelike speech for different using scenarios and users that may have disabilities.

There are other three side features in this App.
4. Allow you to upload images from any device, tablet, phone, PC. etc…
5. Provides flash image memory to allow you to look up images you previously uploaded.
6. You can keep the translated result on the server to share with others.

Imagine that you and your friends are traveling in a foreign country. You walk into a restaurant and you have no idea what the exotic menu is showing. No worry, you can simply take out your smartphone, take a picture and upload to our App. There you go, you will get the translation in your language of the menu line by line in the same format with the original menu.

If the reading condition is not idealable, for example, you are eating outside and the sunlight is too bright for you to read text from your phone. Or if you have reading disabilities. We also provide audio features that can play the recognized menu on your device.

Once you are done uploading and getting the translation. There is no need for your friend to do the hassle of taking a picture and uploading one more time. They can simply access the App and check out the results but just retrieving the same picture you previously uploaded.
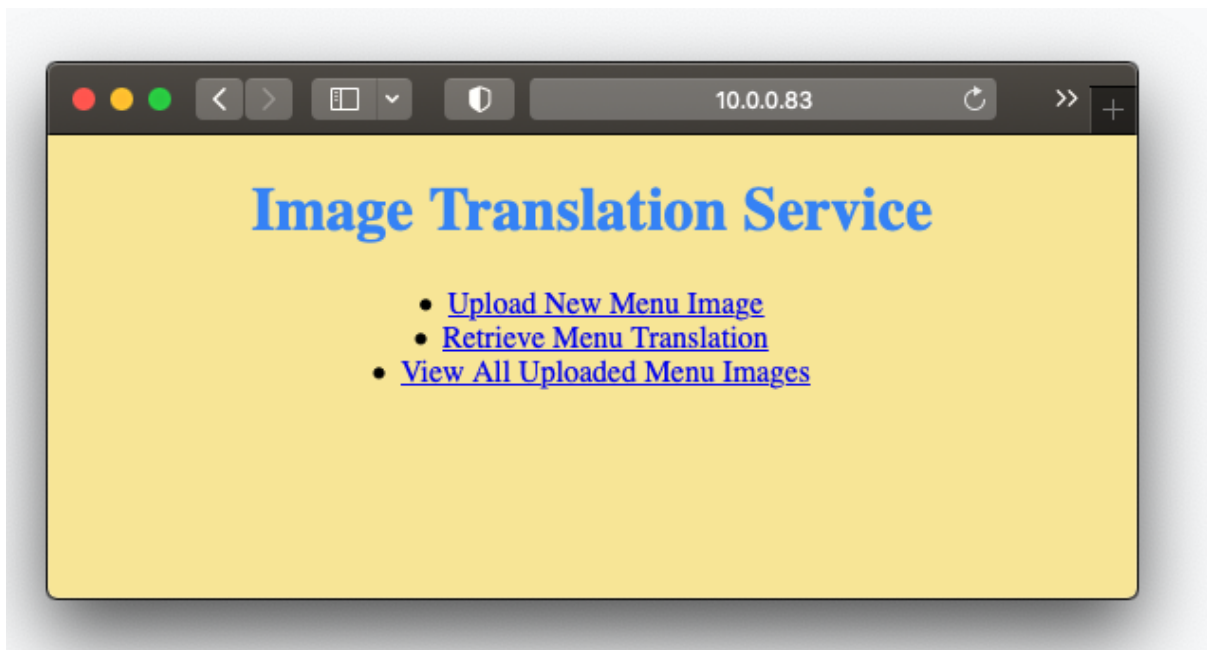

Application Instruction

Description on how to use the application

Interface of Frontend Interaction

1.The Home page

The home page of our web App frontend looks like the following:

There are several pages for different functions.
In each of these web pages, the top left corner has a **Home** button, which can be pressed to go back to this Home web page.

2. Upload New Menu page

The Upload New Image page looks like the following.

Users can put the key into the box and select a file from local to upload. The red text is the message where the web page provides feedback to the user, such as upload results, error message, or instructions etc.

When users successfully upload an image file with a key. The web page will provide feedback as the following.

Upload New Image

Home

Upload New Image

Image Key

Input your new image key here

upload new image | **Browse**

File successfully uploaded with name:t1.jpg key:t007

Submit
3. Retrieve Image

This page is for users to retrieve an image with a key. Just input the key in the box. The red text is the feedback provided by the web page.

When the retrieve is successful, the image and the translation in different languages will be displayed as in the following picture.

And users can press the back to retrieve another image to go back to the image retrieve page to make another retrieve.

Currently, the App can recognize English and translate it to Chinese, French, Hindi, adn Spanish.

The <Read Text> button can be pressed to play the text on the menu.

100% beef hotdog on a white bun served with fries 8

If you have any allergies, please inform your server

spicy items are marked with
gluten free items are marked with GF
gluten free options are listed at the end of each section

Burgers

sub soup 3 • caesar or greek 3 • sweet potato fries 4

RAWHIDES BURGER
half-pound angus beef burger with bacon, aged cheddar,
sautéed mushrooms and onions, lettuce, tomato, barbecue
sauce and chipotle mayo on a toasted bun served with fries 15

SMOKIN' HOT CHICKEN BURGER
breaded hot chicken, shaved coleslaw, bacon, swiss cheese,
red onions and chipotle mayo on a toasted bun served with
fries 15

POSSE BURGER
half-pound angus beef burger with bacon, aged cheddar,
lettuce, tomato, onion, pickles, ketchup, mustard, mayo
and grill sauce on a toasted bun served with fries 15

REUBEN SANDWICH
smoked brisket, sauerkraut, swiss cheese, lettuce, grainy
mustard aioli on a rye bread served with fries 14

CHICKEN RANCH BURGER
crispy or grilled chicken breast, bacon, swiss cheese, lettuce,
tomato and red onion with buttermilk ranch served with fries 15

BISON JALAPEÑO BURGER
bison burger with jalapeño, lettuce, onions, tomato and chipotle
mayo served with fries 16

gluten free beef burger and bun available upon request
add house made gravy 2

Salads

full orders served with a slice of garlic bread

BEETROOT GREEK
romaine, cucumbers, tomatoes, sweet bell peppers, red
onions, beetroot pickles, kalamata olives and feta tossed
in our house made greek vinaigrette FULL 15 HALF 10

RAWHIDES CAESAR
romaine lettuce, bacon, parmesan cheese, croutons with
house made caesar dressing FULL 15 HALF 10

DIJON CHICKEN
sautéed chicken breast strips in creamy dijon sauce, romaine
lettuce, mixed greens, dried cranberries, sliced almonds 18

STEAK BUTTERNUT SQUASH
6oz of sliced aaa canadian tender beef, mixed greens,
roasted butternut squash and feta tossed in our house
vinaigrette dressing 19

LETTUCE WEDGES
iceberg lettuce wedges, bleu cheese dressing, bacon
crumble, and bacon strips 14

Add to any salad
sautéed dijon chicken 6
crispy, blackened, or grilled chicken 6
five blackened tiger shrimp 12

Application Architecture

The architecture of the application, the functions and their interactions in addition to the background process

General Code Architecture

https://docs.google.com/presentation/d/1E8EOrgEyETZJ6KLRJD615p2IjwjGwLRCLnmElsDdyPg/edit#slide=id.g120f8071802_0_0

- ⬡ get_dynamodb_client
- ⬡ get_ece1779_table
- › ⬡ delete_from_dynamo
- › ⬡ put_to_dynamo
- › ⬡ read_from_dynamo
- › ⬡ image_list
- › ⬡ image_upload
- ⬡ image_retrieve
- › ⬡ detect_text
- › ⬡ translate_text
- › ⬡ image_display_operation
- › ⬡ image_retrieve_find
- › ⬡ image_display
- ⬡ image_create
- › ⬡ json_failure_response
- › ⬡ **api_upload**
- › ⬡ read

Delete_from_dynamo, put_to_dynamo, read_from_dynamo are operations for DynamoDB. We use them to read and write metadata of images. Image_list is used to show all image keys in dynamoDB. Image_upload is used to upload images to S3 and write metadata to DynamoDB. Image_retrieve will call image_display_operation, image_retrieve_find and image_display. After retrieving the photo, image_display will call detect_text which uses AWS Rekognition to get text from the image. Then image_display will call translate_text which uses AWS Translate to translate text to other languages. If the user clicks the read button, read will be called, which uses AWS Polly to convert text to speech.
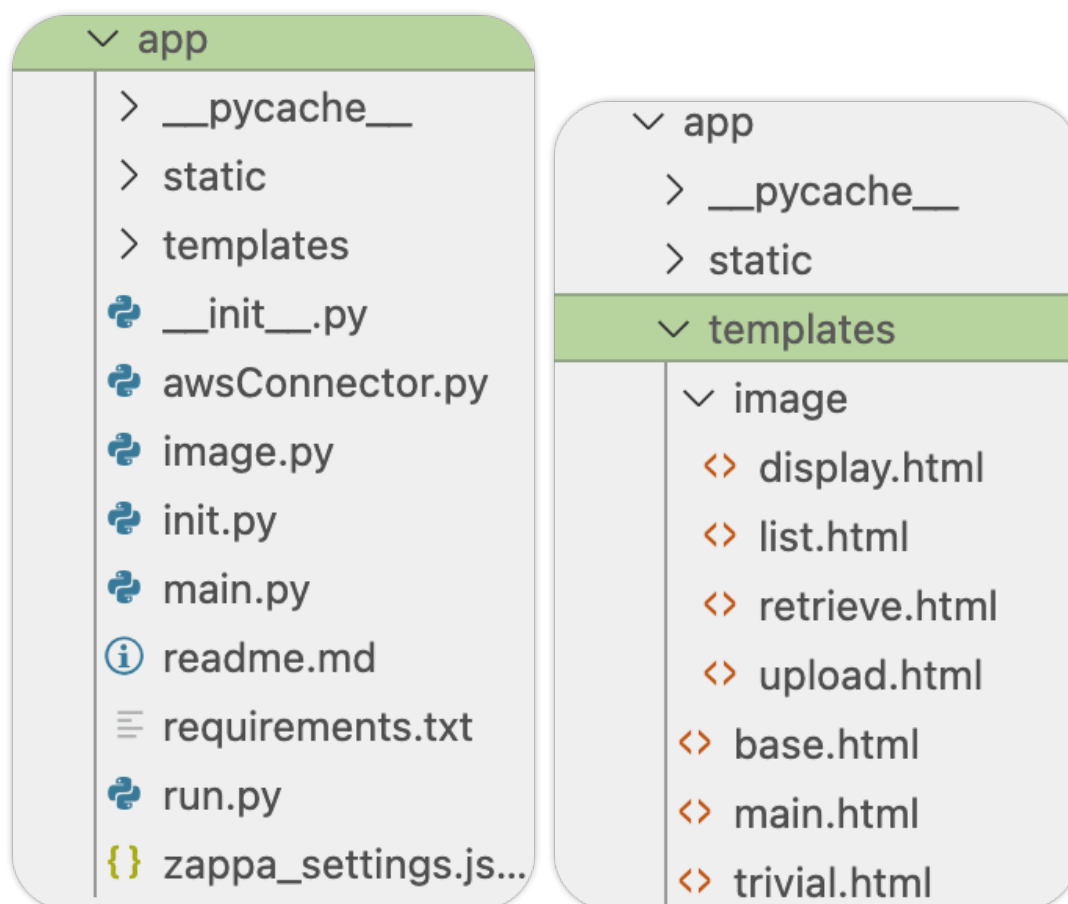

DynamoDB Scheme

We have 1 DynamoDB table. Image_data uses image keys as the primary key and uses the path of image as column `value`. `Update_time` will be set when uploading an image. Background function will use update_time to delete the expired records.

key
value
update_time

The Web Front End

We use Zappa to deploy our Flask instance. Frontend/app folder contains the code for flask and the configuration for zappa. The python code is used for the Web Front End flask instance, which drives the html pages under the templates.

```
∨ app
  > __pycache__
  > static
  > templates
  🐍 __init__.py
  🐍 awsConnector.py
  🐍 image.py
  🐍 init.py
  🐍 main.py
  ⓘ readme.md
  ≡ requirements.txt
  🐍 run.py
  {} zappa_settings.js...
```

```
∨ app
  > __pycache__
  > static
  ∨ templates
    ∨ image
      <> display.html
      <> list.html
      <> retrieve.html
      <> upload.html
    <> base.html
    <> main.html
    <> trivial.html
```

As shown in the above figures, the python files include the coding logics of the Web Front End, and the templates include the web page.

For example,the following figure shows the functions in **image.py,** where these functions are implemented to realize the functions of this App, such as the communication with DynamoDB, the html web page rendering, and API request processing.

Backend database cleaning

A single lambda instance is started after the frontend being successfully initialized. The lambda instance will periodically scan the DynamoDB records, and automatically remove records that have not been updated for a certain amount of time.
The scan period and time-to-live threshold needs to be provided through the lambda API when starting this backend instance.

Application AWS Cost Model

The cost model for AWS costs on application deployment. Also, predicted costs after six months for 10, 1000 and 1000,000 users using your model. Discuss your assumptions about the user behavior, such as requests per day, etc.

We use AWS pricing calculator to predict the cost(https://calculator.aws/#/).

We assume that most typical users use the App during lunch time and dinner time everyday. Each typical using scenario contains around a translation of 10 pages, which is our estimation page number of most typical menus.

And we assume our users are addicted heavy App users, which means they would use the App everyday every meal in the 6 months period, and each meal they take 10 pages of menu pictures. We understand this estimation can only provide the cap for the usage.

Therefore we have:

User number	length	request#/ day	total usage(requests)	Total cost(6 months)
10	6 months	20	36500	0 USD（free tier）
1k	6 months	20	3650k	4.655k USD
1M	6 months	20	3650M	4.655M USD

For the detail of calculation we take the 1M user base as an example, and the calculation is shown below.
